How to unlock ecco tv without remote

By J. Anthony Cooley The remote control is one of the most helpful devices in the house. Samsung TV remotes can become out of sync by accidentally pressing the wrong buttons and deprogramming the remote from the TV. When the remote control is out of sync with the TV, the remote will not operate the TV. In such a case, you need to reprogram your Samsung TV remote control to get it back in sync with the TV. Turn off the TV you are programing the remote for. The TV needs to be turned off for the syncing process to be completed. Even though it's turned off, the TV still catches the signal from the remote control. Press down on the "TV" button on the remote. Pressing the "TV" button tells the remote that it is pairing with a TV so that the remote gives out the appropriate signal during the syncing process. Use a paper clip, tooth pick, or any other item with a thin tip to press down on the tiny indented "Set" button at the bottom of the remote control. Use the link in the resource section to find the code for your TV. Type in the 3-digit code on the number pad of the remote. If the first code doesn't take, continue down the code list until you find a code that works. Press the "Power" button on the remote. If the TV turns on, it means the code worked, but if the TV does not turn on, repeat steps 2 through 5 until the TV turns on from the remote. Even with just six buttons, the Apple TV Siri Remote is a powerful remote control, and it is ever so easy to learn how to use its basic abilities. Lifewire / Ellen Lindner Moving beyond these basics, you can do eight really useful things with this remote (or even a properly configured alternative remote). These may make a positive difference in how you use your Apple TV. Missing volume? Sluggish menus? Stuttering games? Don't fret. You probably won't need to upgrade your broadband or send your Apple TV back to the shop — all you'll need to do is reboot the system. There are two ways to do this: Navigate to Settings > System > Restart.Press the Home and Play/Pause buttons until the lights on Apple TV blink and the Sleep screen appears. Click Sleep to turn off the Apple TV and any attached devices. Press the Home button to restart. If a reboot doesn't solve things, then you may need to consult our advanced troubleshooting tips. You can use the remote control to put your system and your compatible TV to sleep. All you do is press and hold the Home button (the one that looks like a TV screen) until the Sleep screen appears. Tap Sleep. When using the Siri Remote to enter text on Apple TV, you may make a mistake even if you dictate the text. The fastest way to get rid of errors is to use the Siri Remote, press the Microphone button and say Clear, and Siri deletes what you've written so you can start over again. The Menu button does these things for you: Single-click it to go back to the previous screen.Click it twice to go to the Home screen.Tap it three times to access the accessibility shortcuts, if you have them enabled. Apple TV apps run in the background after you launch them, even when you are not using them. They are not active apps, and they aren't doing anything. They are in a hold state until the next time you need them. Apple's tvOS, the operating system that runs Apple TV, is stable enough to handle background apps, and you can use this fact as a fast way to flip between apps. Here's how it's done: Double-tap the Home button to enter the App Switcher view. It is like a carousel of all your active applications showing app previews of each one. After you are in this view, you can swipe left and right between the apps, double-tap an app and immediately start using it, or swipe an app preview upward to close that app. This is a much faster way to navigate between those apps you most often use. When typing in the character input field using your Siri Remote, a quick tap of the Play/Pause button causes the next character you type to be capitalized automatically. That's one of so many useful text input tips for the Apple TV. One of the best text input tips is to use the Remote app on your iPad, iPhone, or iPod Touch for text entry. If you begin watching a movie in a language different from your own, but forgot to enable subtitles before you began watching the movie, you don't need to restart the film. Switch on subtitles while a film is playing on your Apple TV. You won't miss or repeat a moment's action: Swipe down on the trackpad while the movie is playing to reveal a menu at the top of the screen. Look closely, and you'll see a range of settings you can adjust, including controls for subtitles, audio settings and more. Select Subtitles, and they will play with your movie.Flick up on the menu using your remote control to remove it from the screen. You may find scrubbing through a video using Apple TV is an acquired skill, but you should persevere. When you want to move between elements in a movie quickly, remember these tips: Press the Play/Pause button to pause what you are watching before scrubbing.Swipe left or swipe right to move forward and backward in the video.Scrubbing speed responds to the velocity of your finger movement, so a fast swipe moves through the video faster than a slow one. Thanks for letting us know! Tell us why! By J. Anthony Cooley Universal remotes can take the place of the original remote for your TV and allow you to quickly replace your TV remote instead of ordering a replacement and waiting for it to ship from the manufacturer. Universal remotes are available for purchase at most stores and do not cost a lot of money. Setting up a universal remote takes a few minutes and does not require any technical knowledge. Get within a close operating distance of your TV and move any items that may obstruct the signal path of the remote to the TV. During the programing process, the remote will send signals to the TV that the TV must receive to sync with the remote. Press and hold down the "Program" button on the universal remote. Continue to hold the button down for three seconds. When you have held the light down long enough, the LED light on the remote will turn on. Press the "TV" button on the universal remote. This will inform the remote that it is going to link with a TV and will assign the "TV" button to the TV. Locate your remote on the website TV Codes. (See Resources.) Input the first code listed into the remote keypad. It's common for some of the codes not to work for every TV within your TV brand, so move on to the following codes until one works. The LED light will turn off when the code works. Press the "Power" button on the remote to turn your TV on. Plenty of home theater and entertainment devices come with a remote control. Usually, the remote can only operate one device. Some TV remote controls can control other devices within the same brand. For example, most LG, Samsung, and Sony TV remotes can control Blu-ray Disc players of the same brand. However, most people want one remote control that operates all of their devices, regardless of brand. That's what a universal remote control is for. A universal remote control operates basic and, in some cases, advanced features of home entertainment devices from several product brands. Amazon The types of devices that a universal remote can control include TVs, CD/DVD/Blu-ray Disc players, home theater receivers, soundbars, cable and satellite boxes, video game consoles, and streaming devices, such as Roku and Apple TV. Additionally, most universal remotes require you to press buttons. However, some feature a touchscreen, like on a smartphone. A growing number of universal remotes provide access to and control of smart TV features. Although the word universal implies that this type of remote controls everything, in reality, each remote has different levels of universal control. For a universal remote to operate different brands and device models, it needs to be programmed to recognize the device it will control. Universal remotes incorporate one or more of the following programming features: Pre-programmed (also called multi-brand): These remotes can be used with a limited number of devices from select product brands without further programming.Learning: The remote learns the remote control commands of other remotes by pointing a universal remote and a dedicated device remote at each other and programming each command one-at-a-time.Programmable with a code: Program the remote control by entering a special code designated for specific brands and devices or by connecting the remote to a PC via USB and inputting the code from a special website.Programmable without a code: Most programmable remotes include a feature that scans for a code via a series of steps outlined in the user guide, without the need to enter the code. In addition to programming, a universal remote control needs to communicate commands to a target device. This can be done using one or more of the following methods: IR: This is a common method that remotes use to control devices. Each time you touch a button on the remote, it sends a series of infrared light pulses to a sensor located on the front of the TV or other device. The device executes the command. This requires a clear line-of-sight between the remote and the device. If that isn't possible, place accessories such as an IR repeater or IR extender between the remote and the target device, retransmitting the pulses using its IR beam or electrically via a cable connected to an IR sensor input connection.RF: As a solution to the line-of-sight limitation, some universal remotes incorporate an RF (radio frequency) transmitter. This allows you to control devices that are placed inside cabinets or otherwise obstructed. Not many controllable devices have RF receivers that can be used with an RF remote. One solution is to transmit the RF commands to an external RF receiver, with the receiver resending the signal in infrared from the receiver to the device. For additional flexibility, many RF remotes incorporate an infrared option.Wi-Fi: If a universal remote control incorporates Wi-Fi, you can control some smart devices through a home network. Using a variety of apps, this type of remote can control both device functions and content access, such as streaming audio and video. This feature is commonly available with smartphones in conjunction with Wi-Fi supported TVs, home theater receivers, or hubs that receive Wi-Fi signals and relay the command information via IR to the device. However, some handheld remotes can be used with an external control hub to relay commands from the remote through infrared, RF, and Wi-Fi.Bluetooth: Some universal remotes incorporate control via Bluetooth. This is an option for controlling Roku streaming devices and some video game consoles. This means that some universal remotes can use Bluetooth for controlling some devices and IR or RF to control other devices. Logitech All universal remote controls can perform simple tasks, such as raising and lowering the volume, changing channels, and selecting inputs. Some advanced remotes offer control of sound, picture, and device settings. Some remote controls can also perform groups of tasks (referred to as macros or activities). For example, you may be able to execute a task with one button push or touchscreen press, such as turning on the TV, selecting the input for a DVD or Blu-ray Disc player, and playing the disc loaded in the player automatically. A more complex activity or macro task might be to turn on the TV, select the input that a home theater receiver is connected to, turn on a home theater receiver, turn on a specific source connected to the receiver, start the source playback, lower the room lights, and adjust the thermostat. All of this accomplished by the push of a single button or icon on a touchscreen. A universal remote is a common way to get rid of remote control clutter. Still, some alternatives can enhance or limit the need for a handheld universal remote. Voice Control: With the popularity of voice assistants, such as Google Assistant and Alexa, a Google Home or Amazon Echo-type device can control some devices (look for devices that state "Works with Google Assistant" or "Works with Alexa"). When you send commands through a Google Home or Amazon Echo, the Echo communicates with the universal remote to execute the control commands. An example is the Logitech Harmony Elite, Companion, and Pro series remotes.HDMI-CEC: If your TV and components are connected with HDMI cables, HDMI-CEC may be an alternative to a universal remote. HDMI-CEC controls basic functions by using a universal remote or the non-universal remote control that came with the TV. For some HDMI-enabled TVs and devices, HDMI-CEC is enabled automatically, so you can use it without further setup. In most cases, however, you activate it from an on-screen menu. Logitech and Samsung A good universal remote control can make your home entertainment setup easier to use, but it isn't always a complete replacement for the original. Some universal remotes may only control some basic functions, while others provide access to advanced picture and sound adjustments, as well as other features. Logitech Never toss out your original remotes. While you may not use a remote for months at a time, you may need to access functions that the universal remote cannot manage. Having the original remote also comes in handy if you sell your equipment. Before you purchase a universal remote control, consider the following: How many devices you need to control.How many programming options you need to access.How extensive the control options are. Thanks for letting us know! Tell us why!
